

ABSTRACT

An apparatus for disseminating a volatile liquid, such as a fragrance, into an
5 atmosphere from a reservoir, dissemination being achieved by means of a transfer
member in contact with the liquid and a capillary member in liquid transfer contact
with the transfer member. The capillary member comprises an evaporating surface
bearing primary capillary channels, at least some of these primary capillary channels
being intersected by at least one secondary capillary channel, the secondary capillary
10 channel being substantially smaller in cross-sectional area than that of the primary
channels, such that liquid will flow in both primary and secondary channels.
